### QUESTION

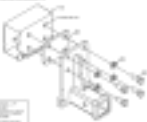

FIGURE 1  
A  
MICROSCOPE

ANSWER  
A microscope is an instrument used to view objects that are too small to be seen by the naked eye. It consists of a series of lenses that magnify the object being viewed. The main parts of a microscope are the eyepiece, objective lenses, stage, and base. The eyepiece is the lens that you look through to see the specimen. The objective lenses are the lenses that are closest to the specimen. The stage is the platform where the specimen is placed. The base is the support structure of the microscope.
