

THE MOUNTAINS OF THE WORLD

Mountains are prominent features of the Earth's surface. They are formed by various geological processes and are found in all parts of the world. The highest mountains are found in the Himalayas, the Andes, and the Alps.

Mountains are formed by various geological processes, including tectonic plate collisions, volcanic activity, and erosion.

THE HIMALAYAS

The Himalayas are a mountain range in Asia, stretching across the border between the Indian subcontinent and China. They are the highest mountains in the world, with Mount Everest being the highest peak at 29,031 feet (8,849 meters).

THE ANDES

The Andes are a mountain range in South America, stretching along the western coast of the continent. They are the longest mountain range in the world, extending for over 4,000 miles (6,400 kilometers).
