

THE HISTORY OF THE HUMAN GENOME PROJECT

1980s: The first human genome map was created, showing the location of genes on chromosomes.

1990s: The Human Genome Project was launched, a large-scale international research effort to determine the sequence of the human genome.

1996: The first draft of the human genome was published, showing that the human genome contains approximately 3 billion base pairs of DNA.

2000: The first complete draft of the human genome was published, showing that the human genome contains approximately 3 billion base pairs of DNA.

2003: The Human Genome Project was completed, and the first complete draft of the human genome was published.

2008: The first draft of the human genome was published, showing that the human genome contains approximately 3 billion base pairs of DNA.
